Recommendations & Method

How to play these predictions

STRATEGY: Submit the EV-optimal score per tie (max expected Scorito points), not the bare most-likely score -- the toto term dominates, so never pick a draw when a win is favoured. For top scorers, pick by Scorito value (goals x position x stage: a defender/keeper goal pays 4x a forward's), not raw goals. Model's title pick: Argentina (19.1%, worth 250 bonus pts).

Champion pick: Argentina (19.1%). Safe R16 backers: Argentina, France, Spain, England, Germany, USA.

Methodology

1. Team strength starts from Elo priors adjusted by researched form/injury notes.
2. A Dixon-Coles bivariate Poisson model turns strength into scoreline distributions;
parameters are refined by a ridge-penalised fit on observed results (shrinking to priors).
3. A Monte Carlo simulation plays out the bracket many times -> progression probabilities,
with extra time and strength-tilted penalty shootouts for knockout ties.
4. Each team's expected goals are shared among its players (form-adjusted) and weighted by
how far the team is projected to advance -> per-stage and Golden Boot scorer forecasts.
